特徴

- Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit.
- Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins.
- This gene encodes a ribosomal protein that is a component of the 60S subunit.
- The protein belongs to the L36E family of ribosomal proteins.
- It is located in the cytoplasm.
- Transcript variants derived from alternative splicing exist; they encode the same protein.
- As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed through the genome.
- [provided by RefSeq].
- Applications: Suitable for use in Western Blot, FLISA
- Recommended Dilution: FLISA: 1:1,000 Western Blot: 1:100-500
